CASE STUDY · SAUDI ENERGY

B2B Payment Journey

How a business customer pays for many commercial accounts (properties) in a single transaction.

Status: internal draft, not for client or external use

Prepared: 14 October 2026

MY ROLE

UX designer: research, UX and UI

I was the UX designer on the B2B payment journey for Saudi Energy, responsible for the research, the user experience and the UI.

Research

Studied how business customers hold, group and pay for many properties, and where paying one bill at a time slows them down. That shaped the four ways to choose what to pay.

UX

Mapped four ways of paying (multiple accounts, single account, multiple groups, single group) and wireframed each one, including the no-card and card-error paths.

UI

Designed every step for mobile (375px) and desktop (1440px), covering empty, error, loading and success states.

CONTEXT AND PROBLEM

One customer, many properties

The starting point for the B2B payment journey.

PROBLEM STATEMENT

Business customers with many properties have to pay each bill separately, repeating the same steps every time, and have no single place to see what is due across all of them.

How might we let a customer find, select and settle many accounts in one payment, while staying within the existing B2C payment foundation?

Context

Saudi Energy's business customers manage many commercial accounts, one for each property. Each account has its own bill. The journey lets a customer settle several accounts in one payment, choosing them one by one, by group, or by uploading a CSV.

The problem

Paying each property separately means repeating the same steps for every bill, with no single place to see what is due across all properties.

The starting constraint

B2B had to follow the existing B2C payment flow, because both share the same code foundation. The new work therefore sits in how accounts are selected and grouped before the shared payment steps.

THE JOURNEY AT A GLANCE

One payment path, four ways in

Every journey ends in the same eight steps. Each step is designed for mobile (375px) and desktop (1440px).

1
Dashboard
The user starts from the dashboard.

2
Select accounts or groups
What is selected depends on the journey. Selection screens include a "Pay for everything" option and an editable amount per account.

3
Select card
The payment method screen offers Apple Pay, a saved card or a new card, with a note about paying by collective accounts. An empty state shows if no card is saved.

4
Card selected
Card details show filled, or with field errors.

5
Enter CVV
The user confirms the card.

6
Review payment
Shows the number of accounts and the total, VAT included. Long lists scroll.

7
Payment gateway
A loading screen while the bank confirms. This page is not in the team's control.

8
Success
Shows total paid and number of accounts.

THE FOUR JOURNEYS

What the user selects changes the first steps

The dashboard offers accounts or groups. Everything after card selection is shared.

JOURNEY 1
Multiple accounts
The user picks accounts from the full list and can change the amount per account. They can also pay extra. The list loads more as the user scrolls, with no pagination.

JOURNEY 2
Single account
The user selects one account from the list, or opens its account details and pays from there.

JOURNEY 3
Multiple groups
The user selects several groups, then views the accounts that need to pay dues. They can modify which accounts are included. More than 10 accounts shows a "View all accounts" action that opens a popup.

JOURNEY 4
Single group
The user opens one group and sees its details, then the accounts that need to pay dues, which they can select or deselect. A group with 200 accounts and 12 pending shows 12/200.

Shortcut: upload a CSV

A customer who already keeps all their properties in a spreadsheet can export a CSV and upload it, instead of selecting accounts one by one. The designs show the result as a count of accepted accounts with lists of added and rejected accounts.

MY DESIGN JOURNEY

From research to screens

How the work moved, based on what the project files show.

01
Research
Understand how business customers manage and pay for many properties, and where the single-bill flow slows them down.

02
Map the journeys
Start from the existing B2C flow, then map the four journeys on a Miro board, with notes for rules such as lazy loading, Safari-only Apple Pay and the "View all accounts" popup.

03
Wireframe
Wireframe each journey as its own lane, from dashboard to success screen, with the no-card and card-error paths.

04
Design the UI
Turn the wireframes into UI for mobile and desktop, with empty, error, loading and success states.

05
Edge cases and notes
Cover long lists, card errors and the bank-confirmation wait. The Miro board carries notes on constraints, such as the gateway page being outside the team's control.

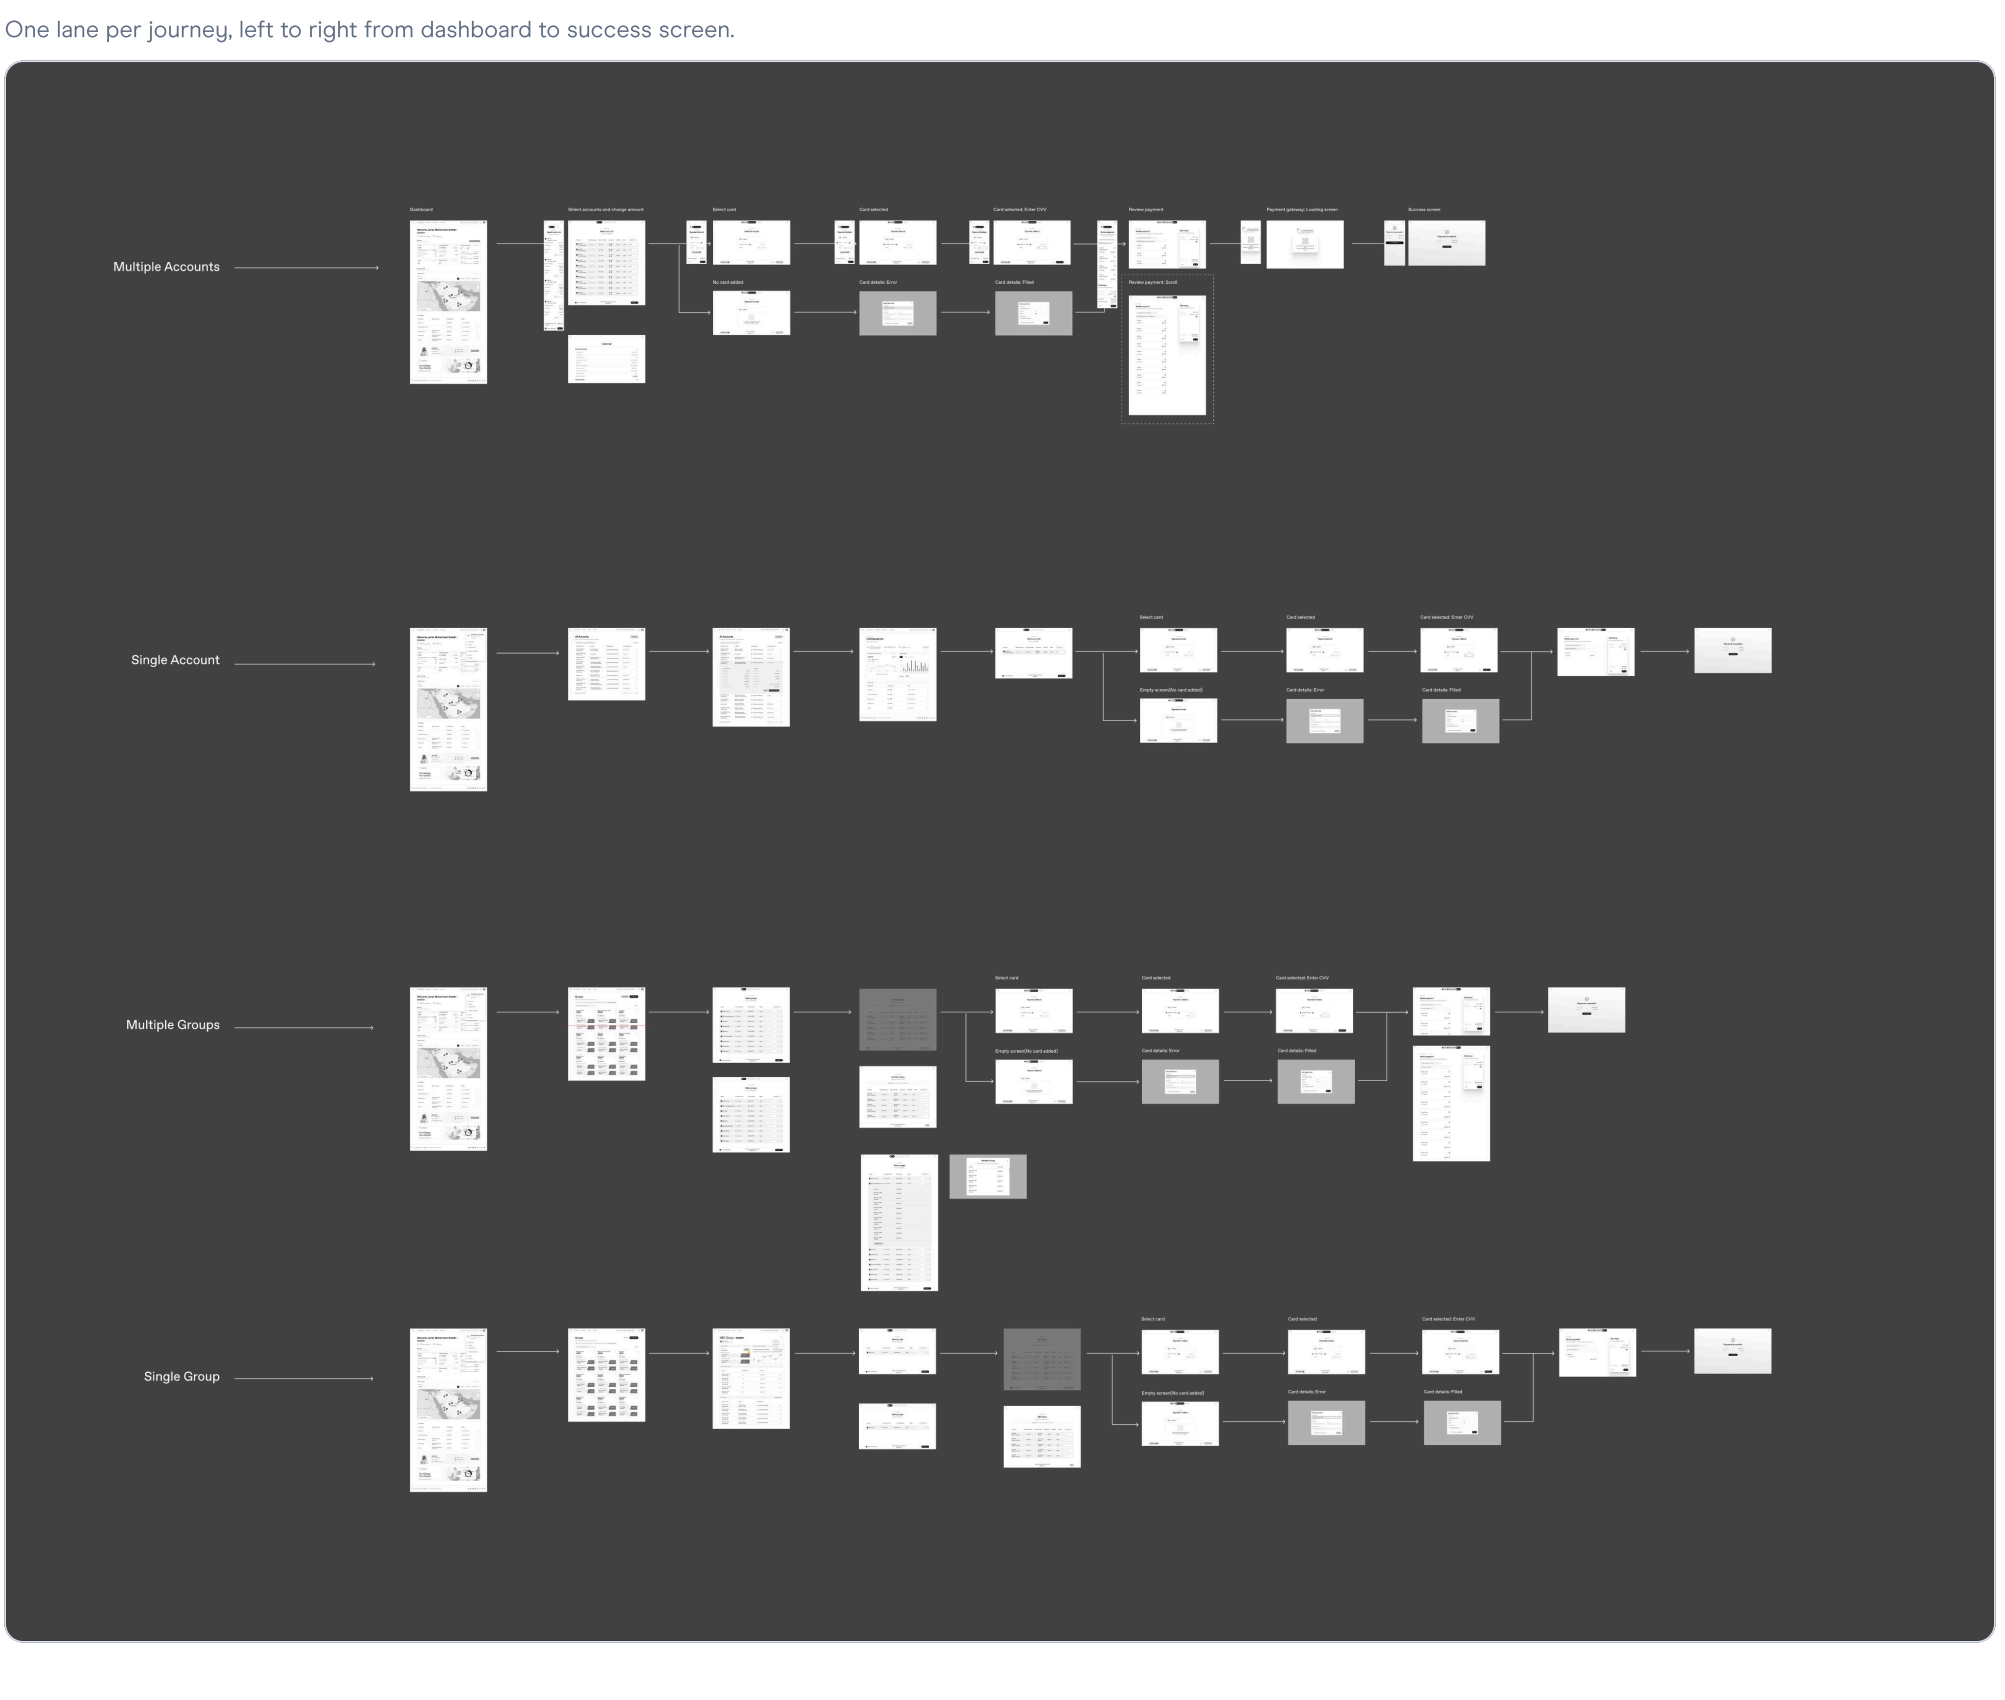
UX WIREFRAMES

How the flow was mapped

One wireframe lane per journey, from dashboard to success screen.

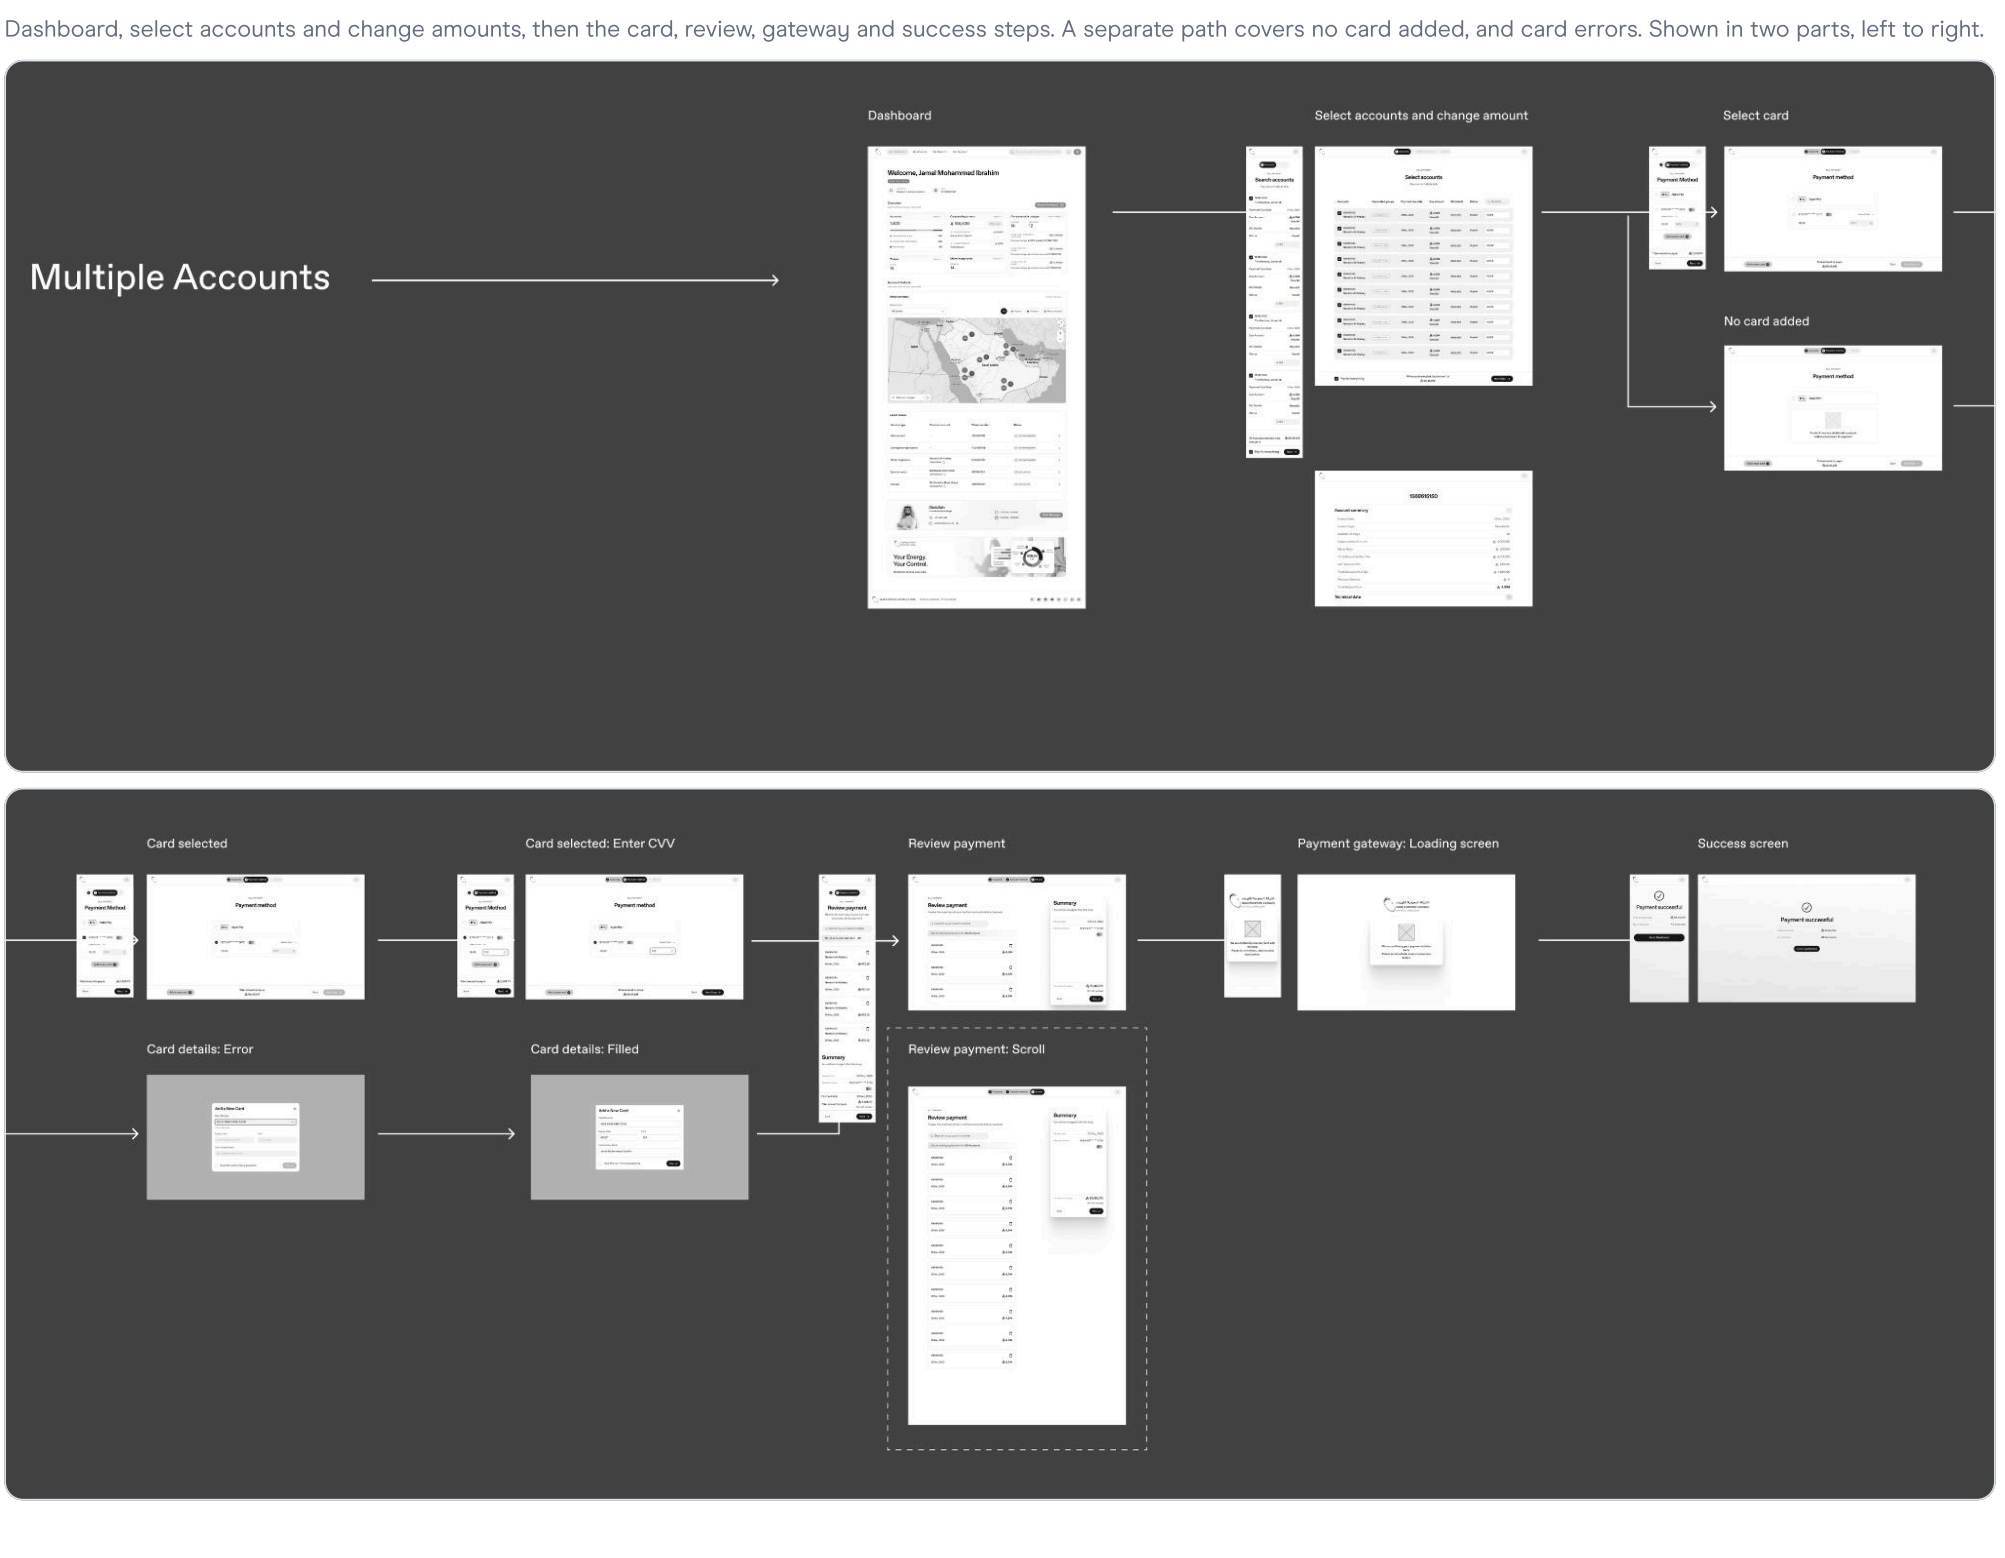
All four journeys

One lane per journey, left to right from dashboard to success screen.



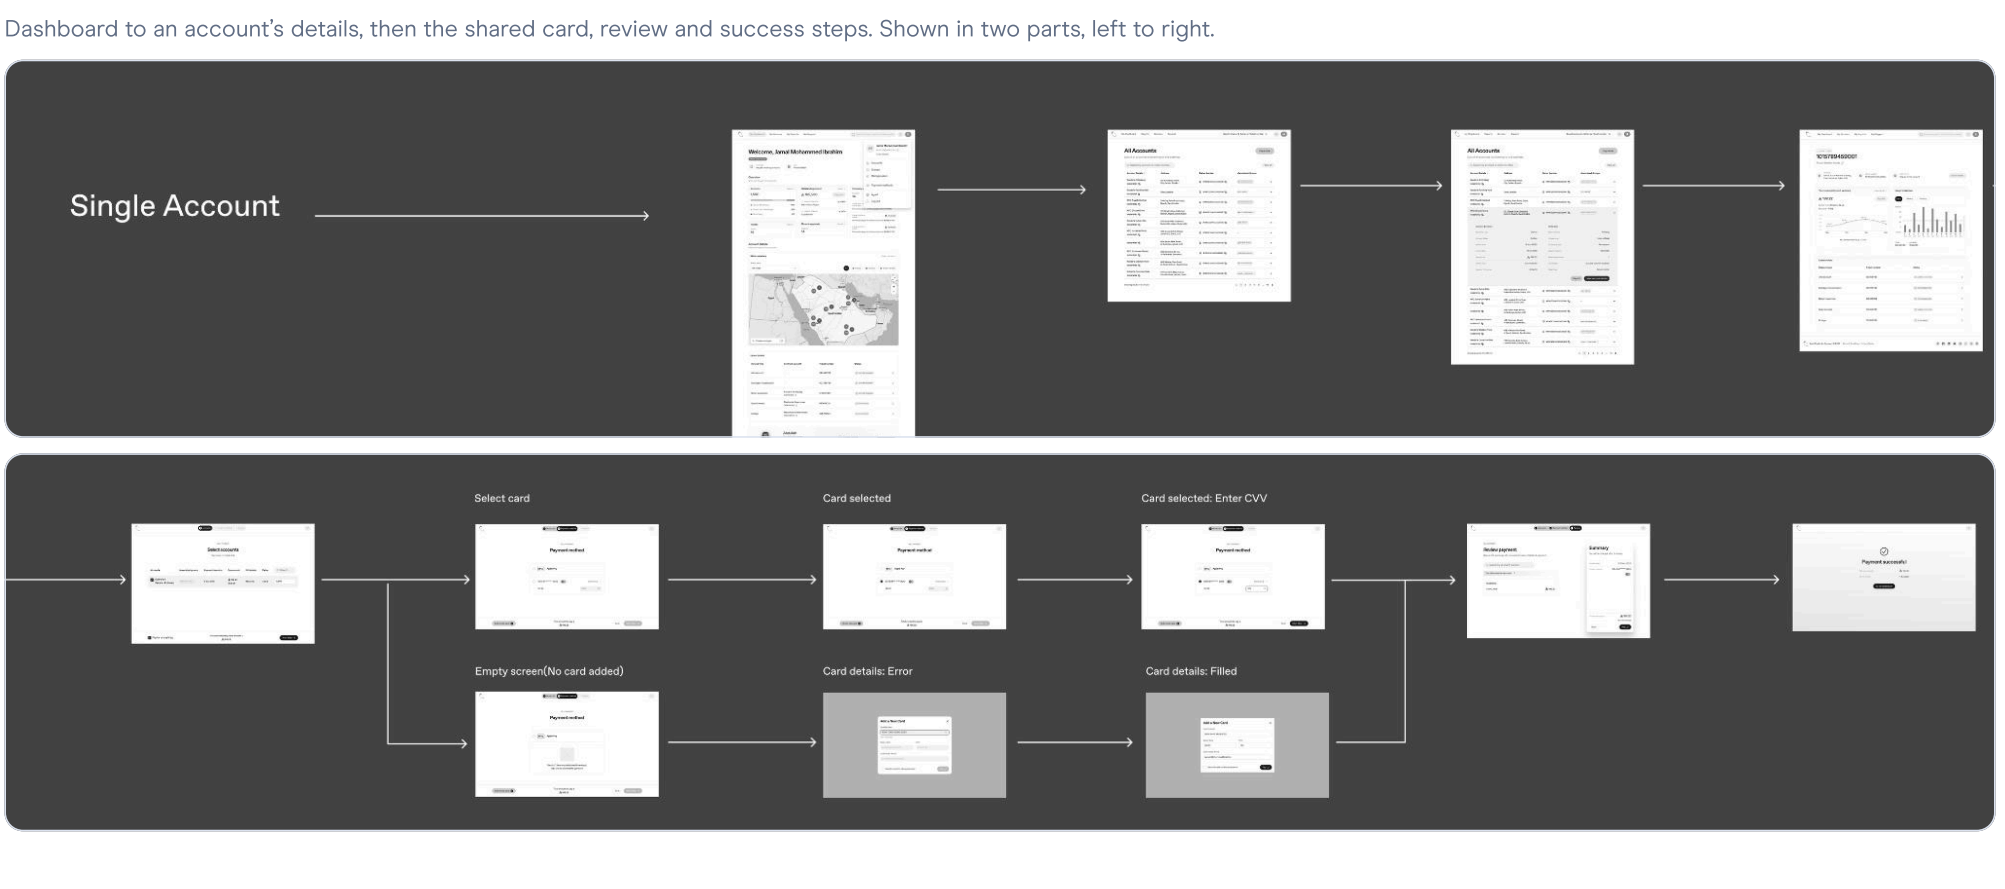
Multiple accounts

Dashboard, select accounts and change amounts, then the card, review, gateway and success steps. A separate path covers no card added, and card errors. Shown in two parts, left to right.



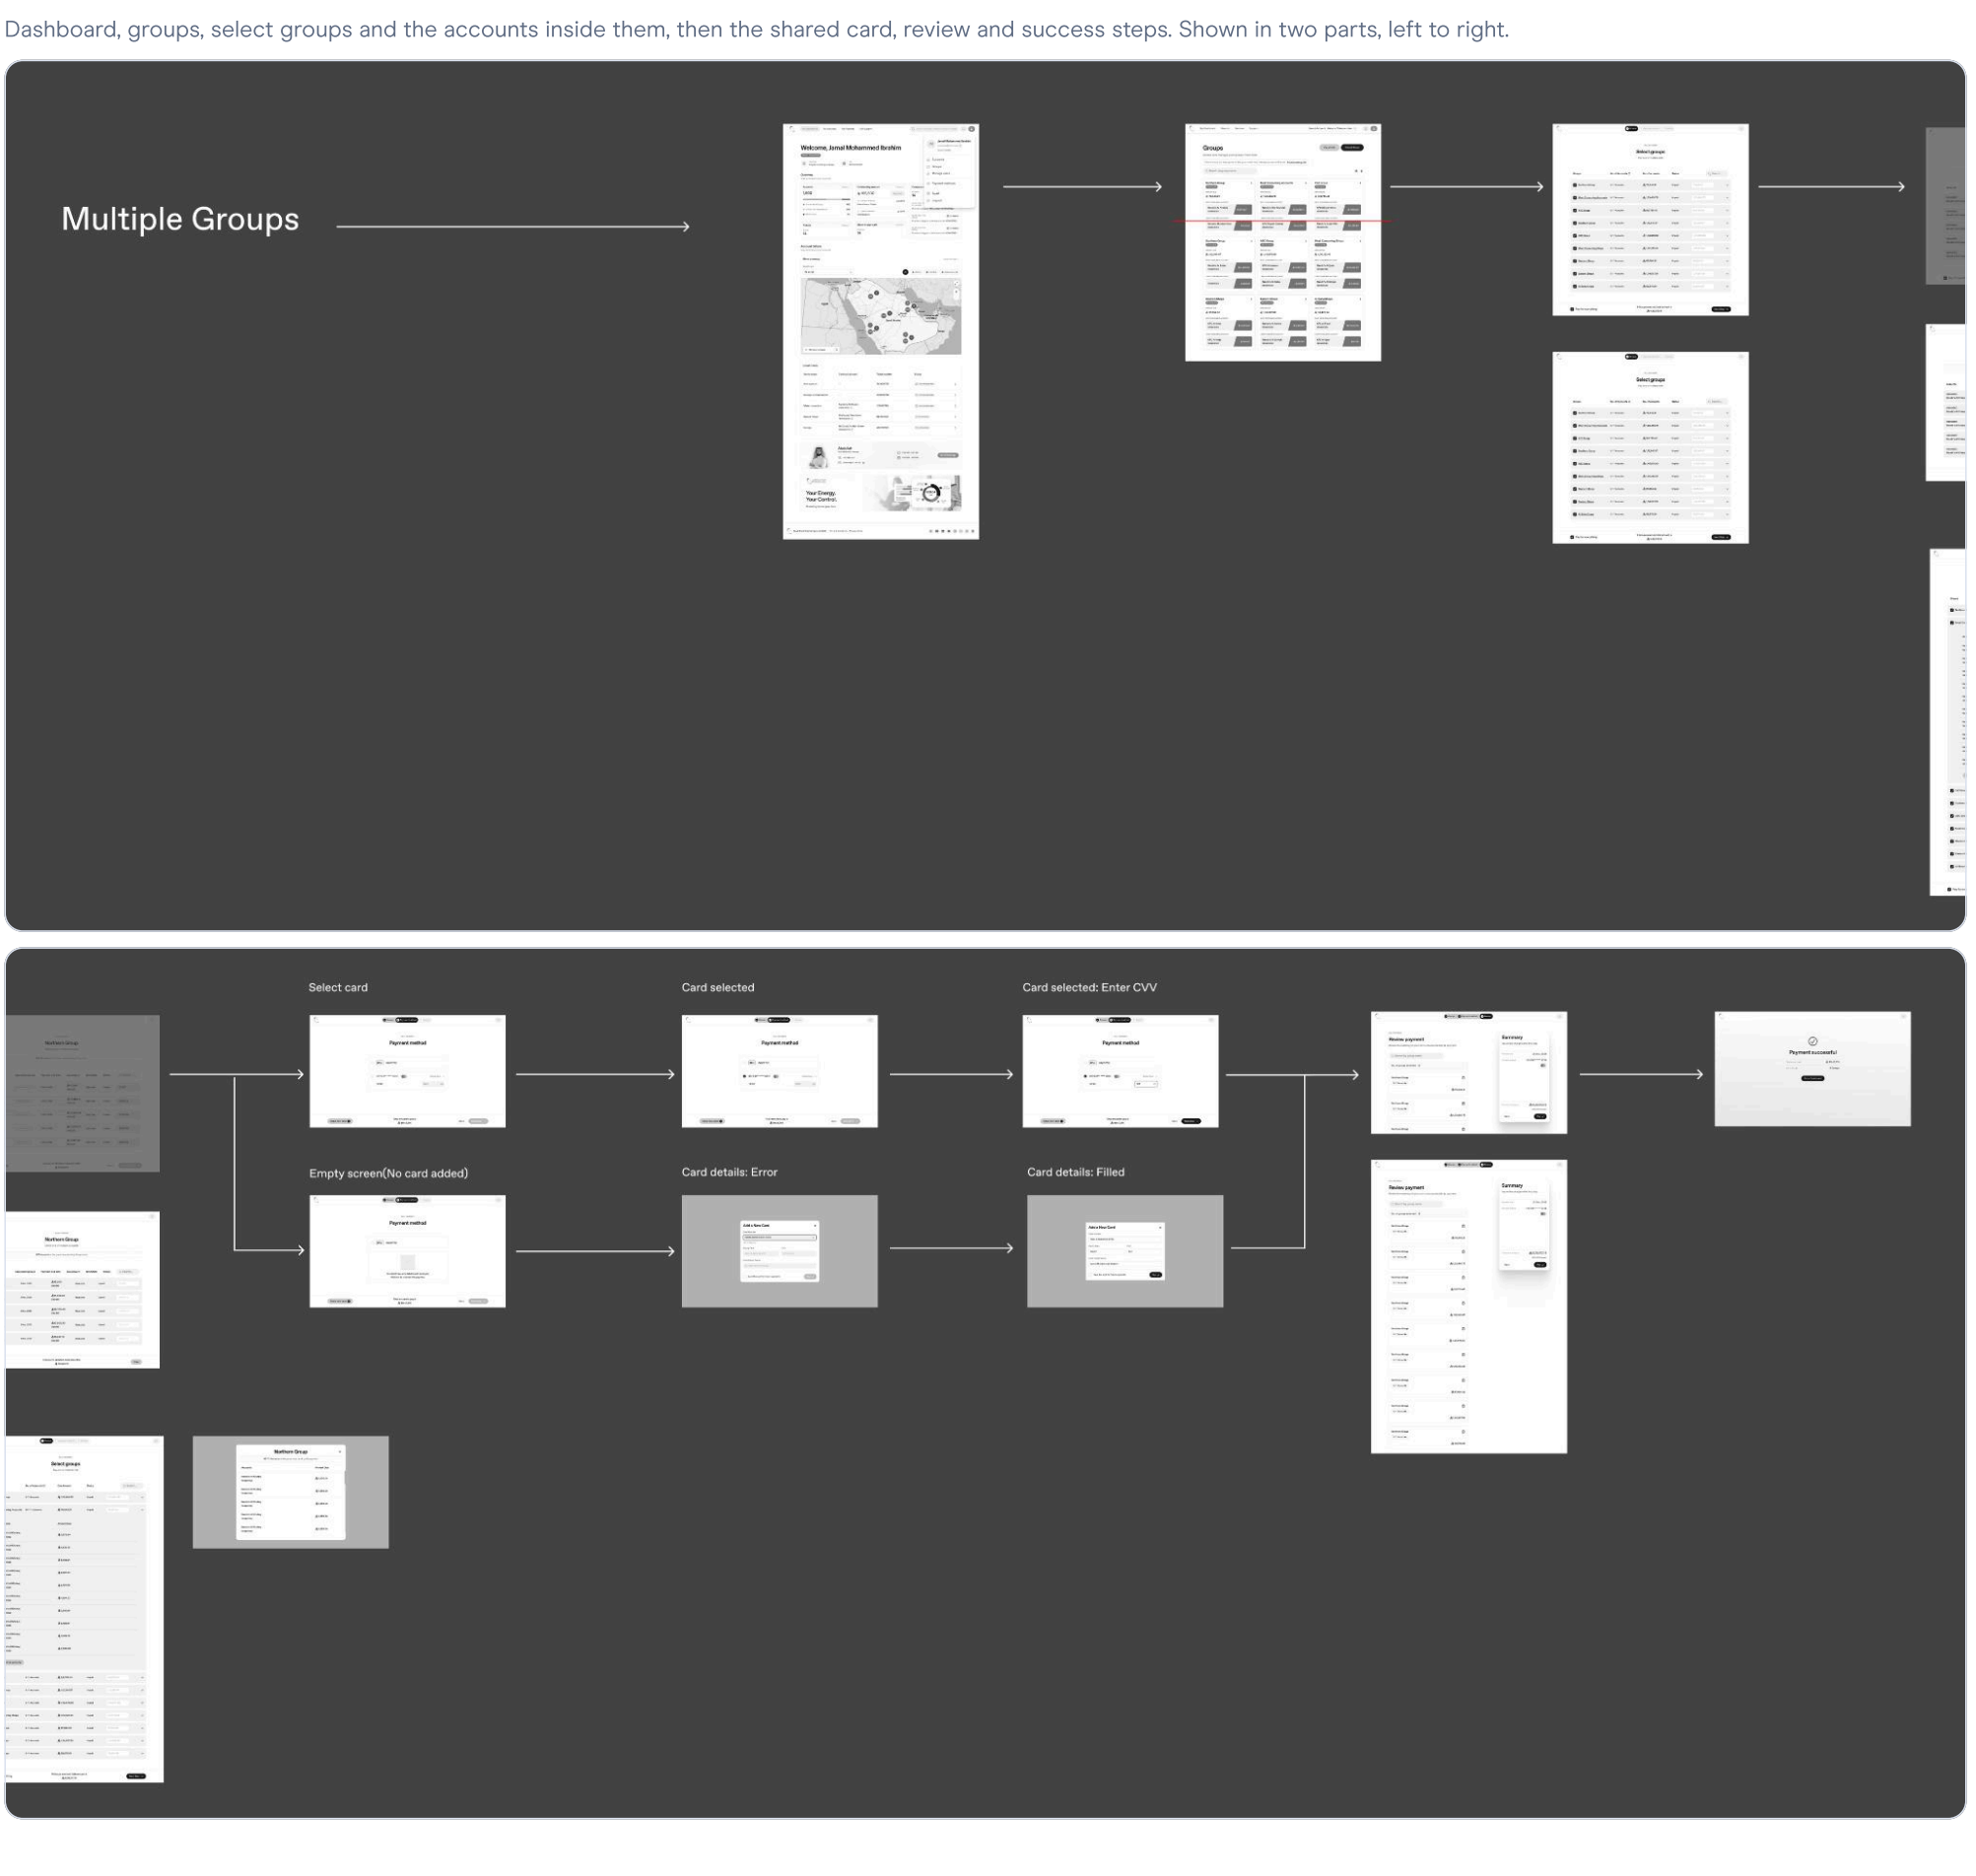
Single account

Dashboard to an account's details, then the shared card, review and success steps. Shown in two parts, left to right.



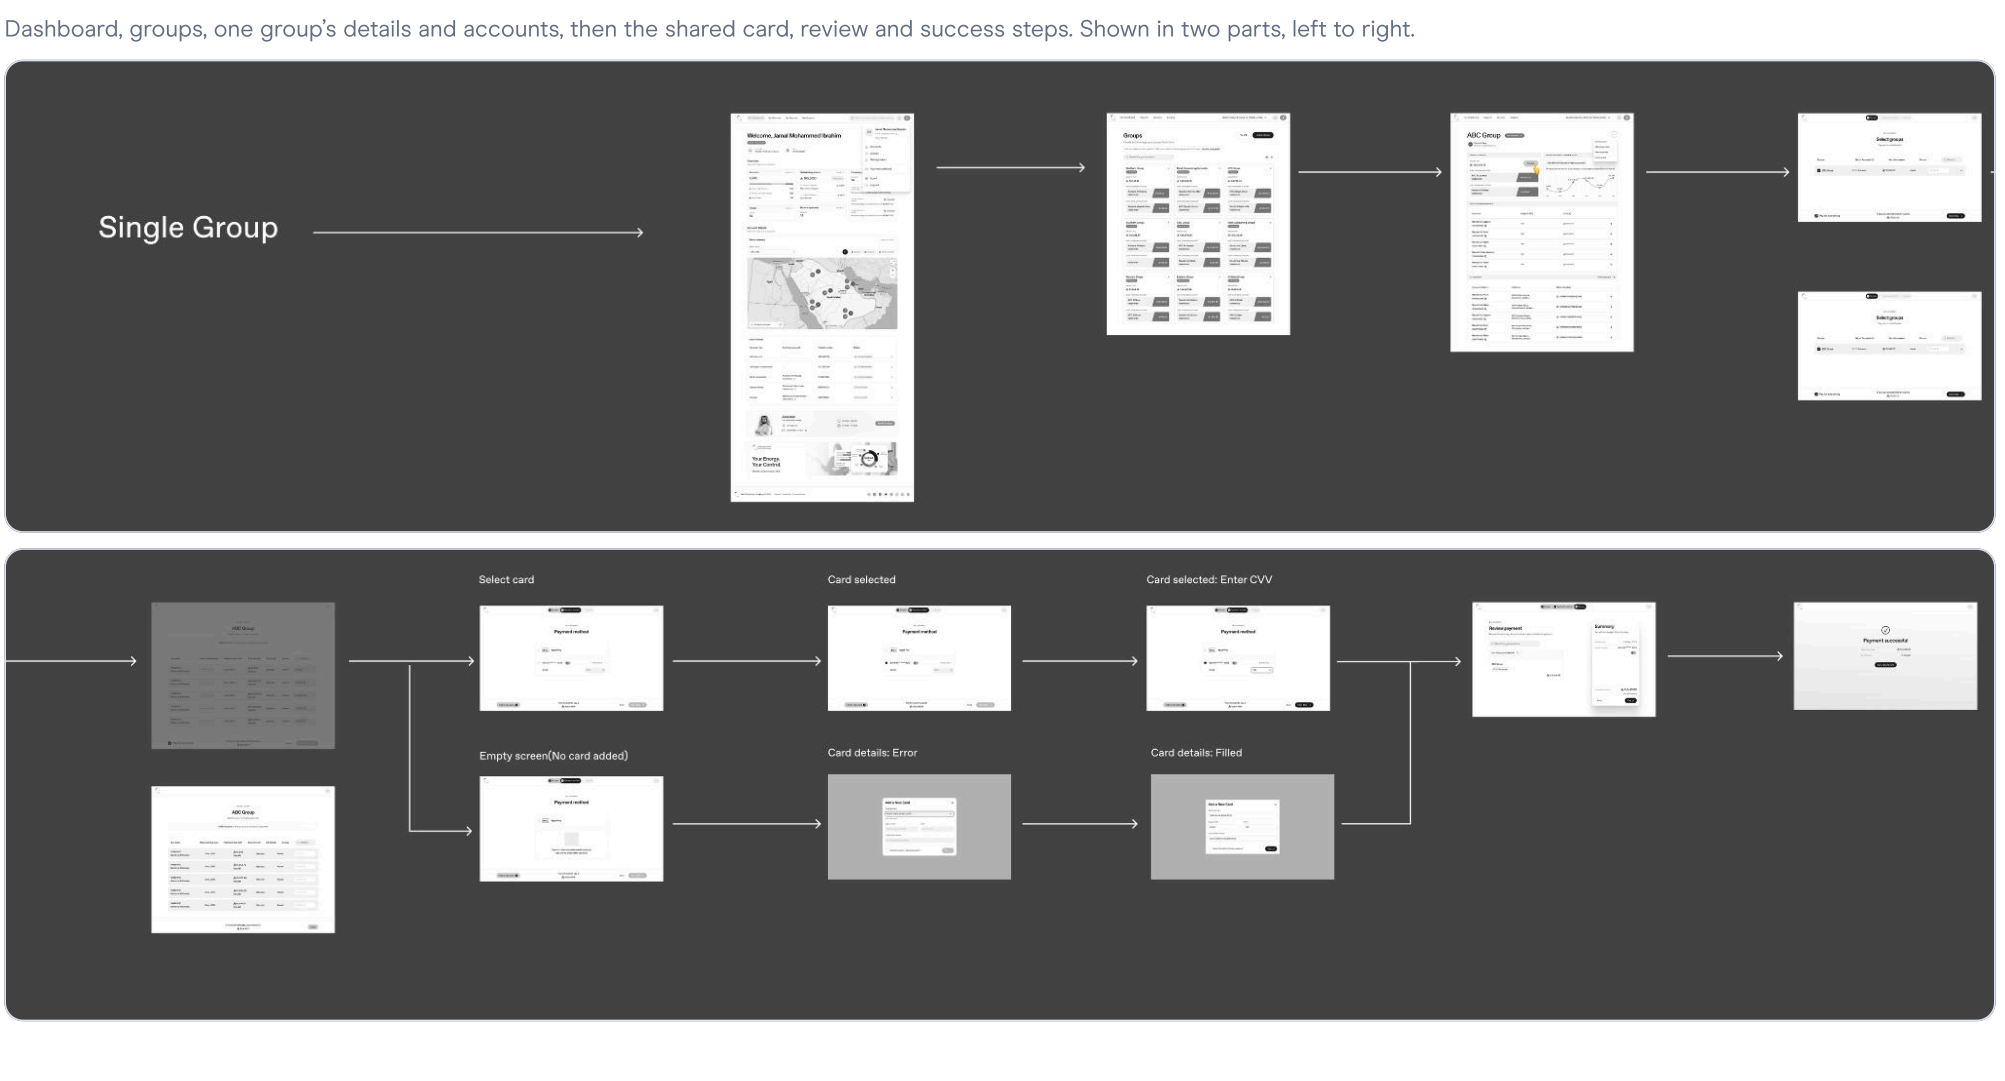
Multiple groups

Dashboard, groups, select groups and the accounts inside them, then the shared card, review and success steps. Shown in two parts, left to right.



Single group

Dashboard, groups, one group's details and accounts, then the shared card, review and success steps. Shown in two parts, left to right.



THE UI SCREENS

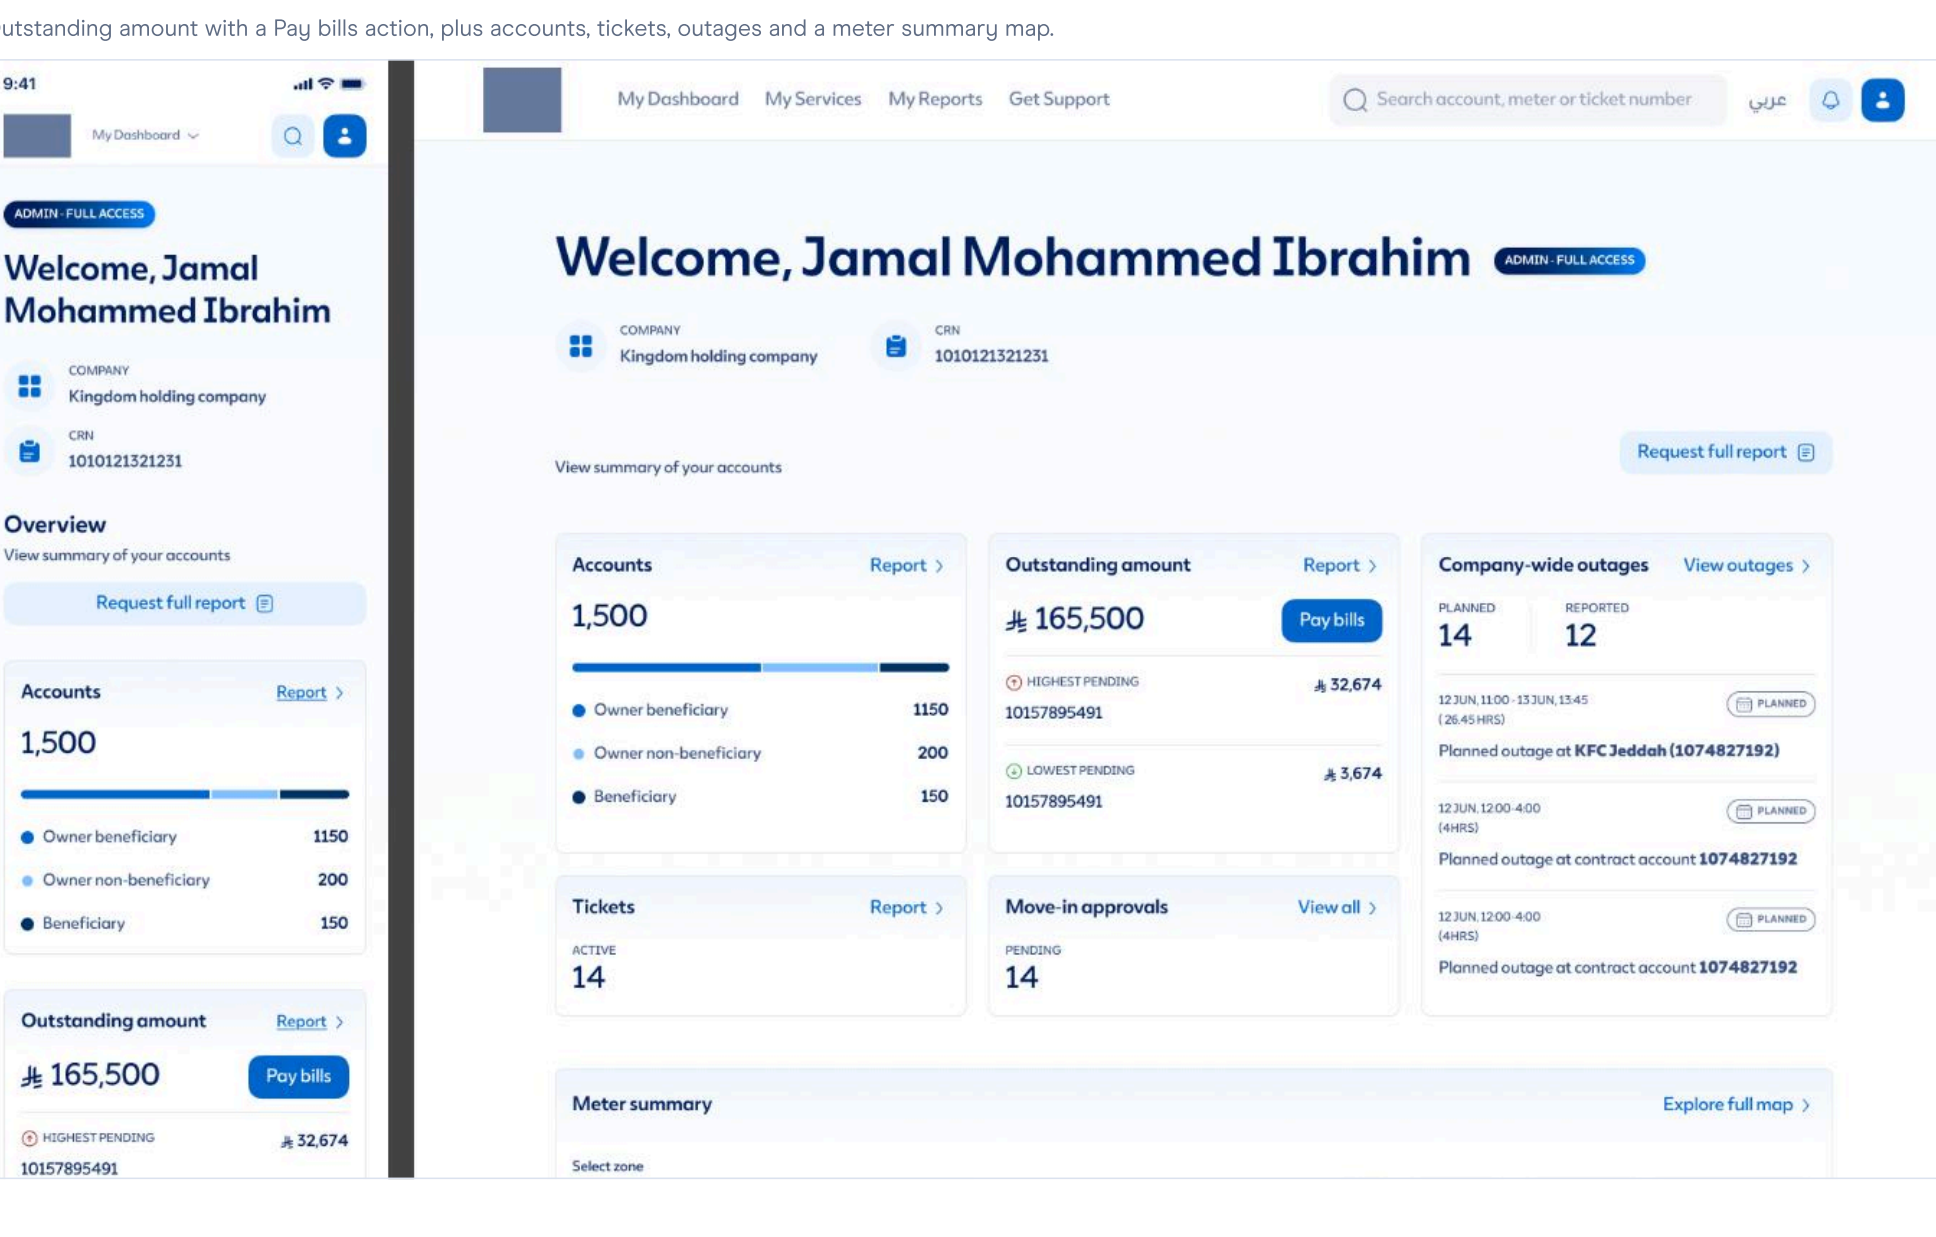
What the user sees

Each screen is shown on mobile (left) and desktop (right). Long pages are cropped to the top.

Choosing what to pay

Dashboard

Outstanding amount with a Pay bills action, plus accounts, tickets, outages and a meter summary map.



Welcome, Jamal Mohammed Ibrahim

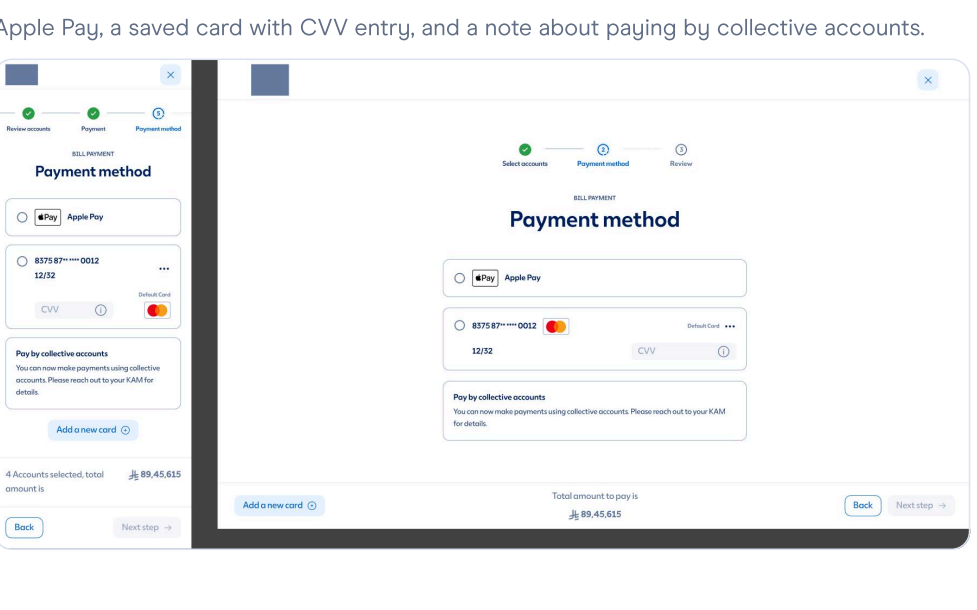
Paying

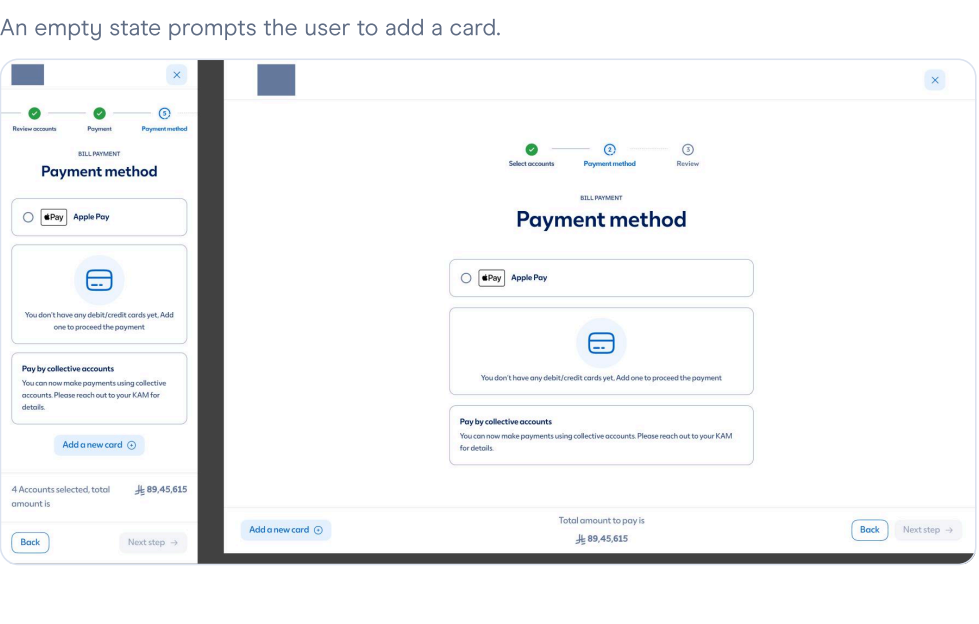
Payment method: card saved

Apple Pay, a saved card with CVV entry, and a note about paying by collective accounts.



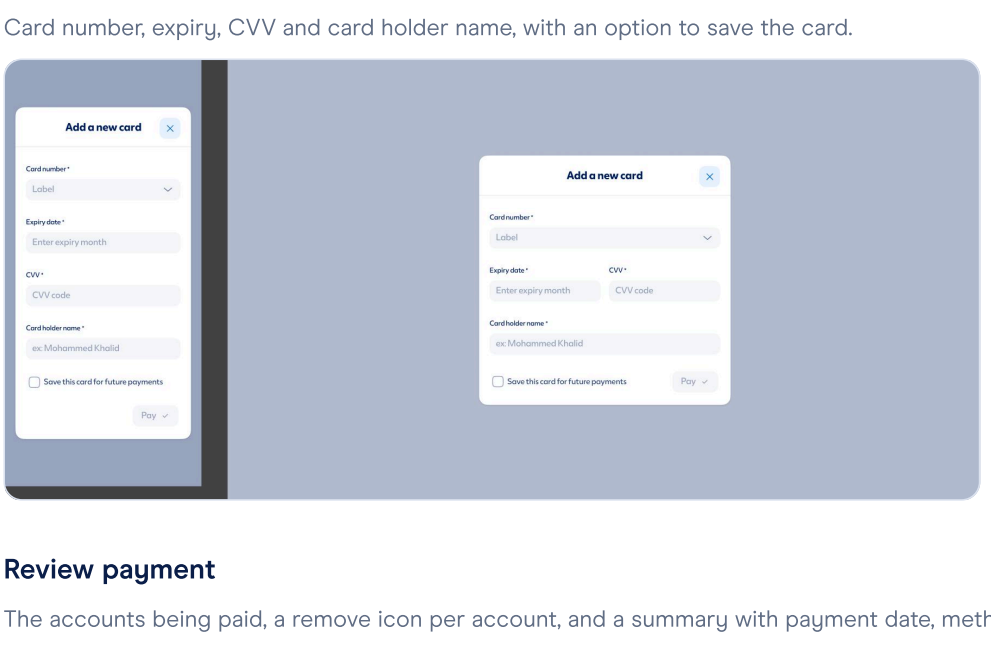
Payment method: no card

An empty state prompts the user to add a card.



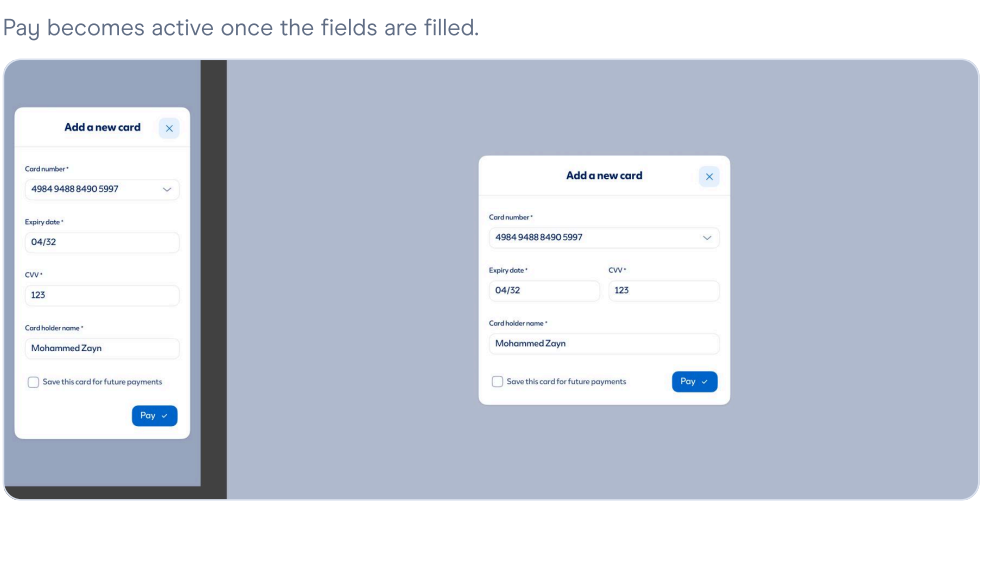
Add a new card: empty

Card number, expiry, CVV and card holder name, with an option to save the card.



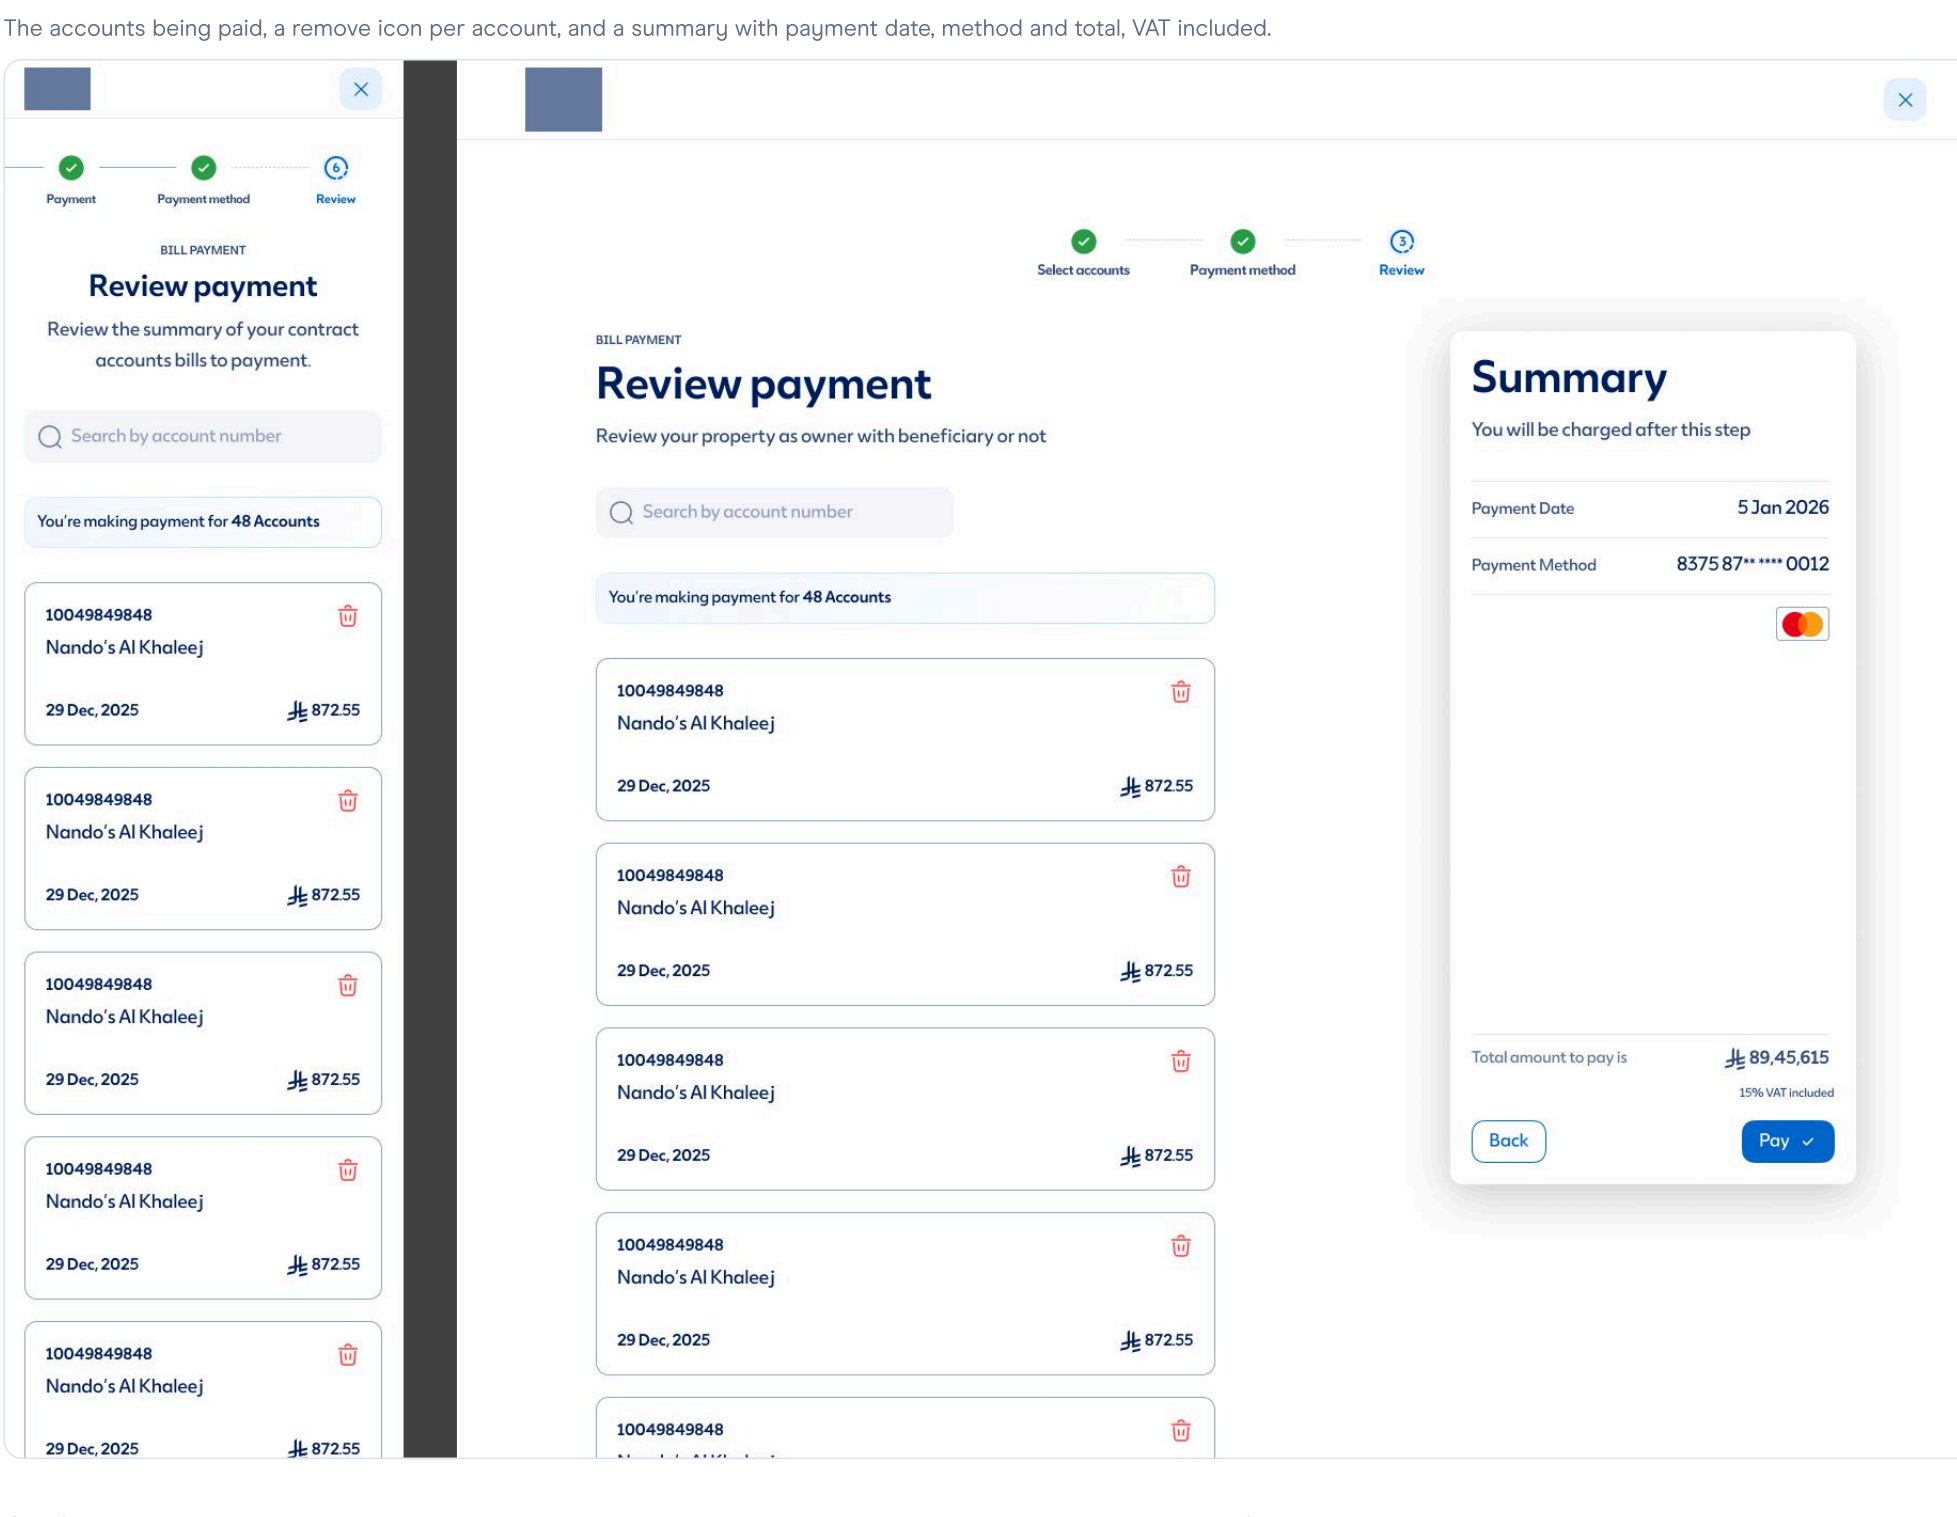
Add a new card: filled

Pay becomes active once the fields are filled.



Review payment

The accounts being paid, a remove icon per account, and a summary with payment date, method and total, VAT included.



BILL PAYMENT

Review payment

Review your property as owner with beneficiary or not

You're making payment for 48 Accounts

10049849848 Nando's Al Khaleej — 29 Dec, 2025 — ⃁ 872.55

Summary

You will be charged after this step

Payment Date: 5 Jan 2026

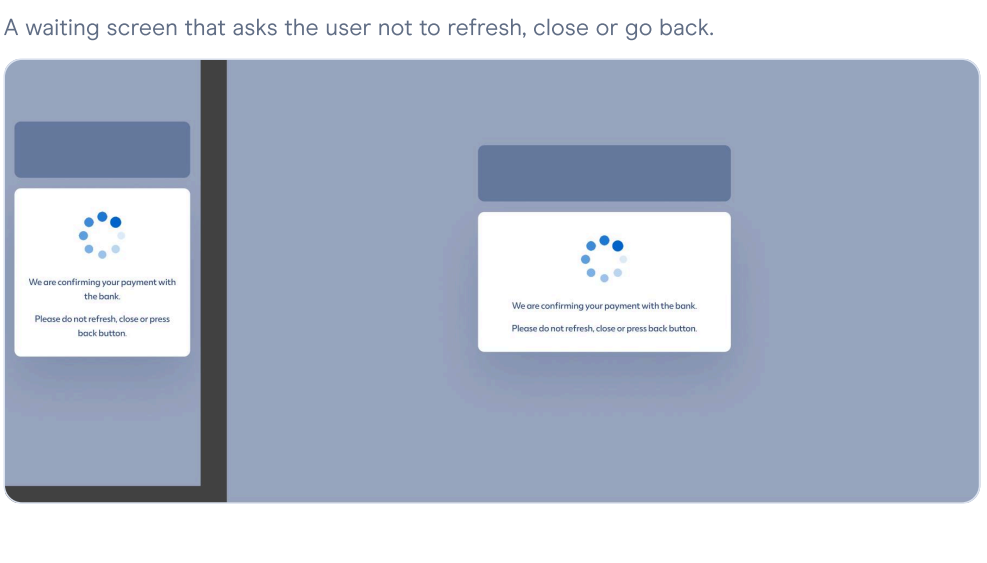
Payment Method: 8375 87** **** 0012

Total amount to pay is ⃁ 89,45,615

15% VAT included

Confirming with the bank

A waiting screen that asks the user not to refresh, close or go back.

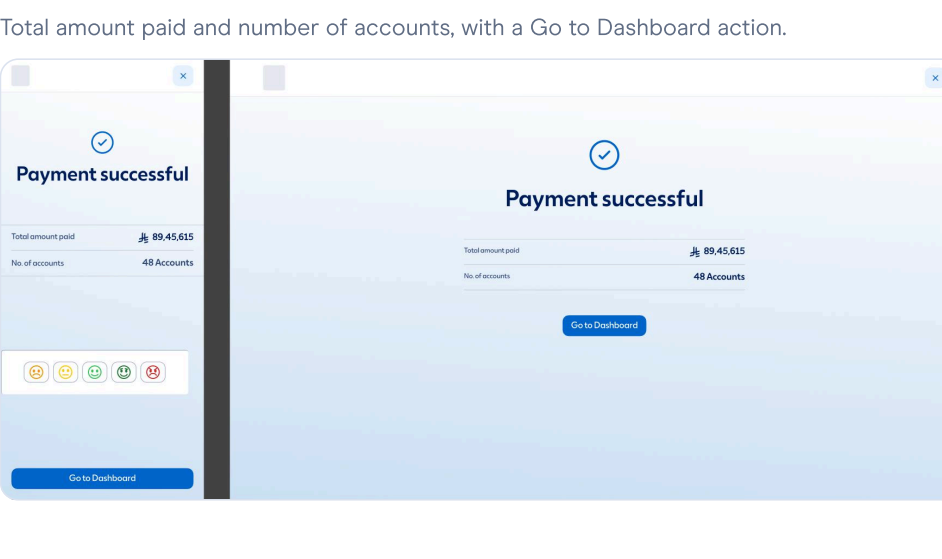


We are confirming your payment with the bank.

Please do not refresh, close or press back button.

Payment successful

Total amount paid and number of accounts, with a Go to Dashboard action.



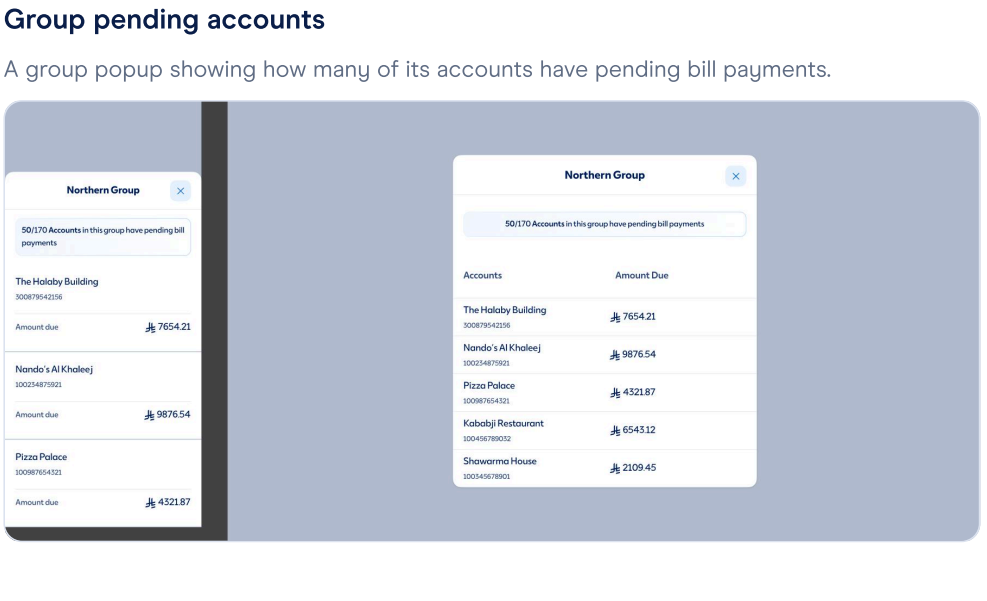
Payment successful

Total amount paid: ⃁ 89,45,615

No of accounts: 48 Accounts

Group pending accounts

A group popup showing how many of its accounts have pending bill payments.



Northern Group

50/170 Accounts in this group have pending bill payments

Accounts	Amount Due
The Halaby Building	⃁ 7654.21
Nando's Al Khaleej	⃁ 9876.54
Pizza Palace	⃁ 4321.87
Kababji Restaurant	⃁ 6543.12
Shawarma House	⃁ 2109.45

DESIGN DECISIONS AND CONSTRAINTS

What shaped the flow

Follow the B2C flow	B2B reuses the existing B2C flow because the developers' code foundation is shared, so the flow could not be changed.
Keep "pay extra"	Users can pay more than the amount due. As in B2C, the extra amount shows in green.
Show only accounts that owe	In group journeys the user sees only accounts with a pending payment, and can select or deselect any of them.
Handle long lists	No pagination: lists load on scroll. When a list has more than 10 accounts, a "View all accounts" popup is offered.
Card errors stay in place	A wrong card shows field errors and the user stays in the same popup.
Apple Pay in Safari only	Apple Pay is offered only in Safari. Other browsers see the standard card screen. There is no QR code flow.
One payment, all or nothing	The whole batch succeeds or fails in one go. Failure handling follows B2C, so no separate failure screen was designed for B2B.
No account limit for now	The client recently asked for a maximum of 100 accounts per payment. It is parked, because it raised many edge cases: which accounts count, selections across several groups, and CSV rows above the limit. Reinstating it needs agreement and sign-off.
Offer "Pay for everything"	The selection screens include a Pay for everything option, with the selected total shown in the footer.
Point to collective accounts	The payment method screen tells users they can pay with collective accounts and to contact their key account manager for details.

OUTCOMES

What the design delivers

What the flow makes possible for a business customer paying for many properties.

One payment for many properties

A customer can settle many accounts in a single transaction instead of repeating the payment flow for every bill.

Four ways in, one path

Selecting by accounts, a single account, groups or a single group all lead to the same card, review and success steps, so the payment itself stays consistent.

Built on the B2C foundation

Reusing the B2C flow carried over familiar behaviour, such as pay extra, field-level card errors and the gateway step, and kept the build on the shared code base.

Focus on what is owed

Group views list only accounts with a pending payment, for example 12 of 200, so the user works from a short, relevant list.

Handles large estates

Lists load as the user scrolls, long groups open in a "View all accounts" popup, and a CSV upload offers a shortcut for customers who already track their properties in a spreadsheet.

Clear before paying

The review step shows the number of accounts, each account's amount with a remove option, and the total with VAT included. A waiting screen then confirms the payment with the bank.

Mobile and desktop

Every step is designed for both mobile (375px) and desktop (1440px).

END-USER BENEFITS

How the customer benefited

For a business paying for many properties, the flow removes repetition and gives clarity at each step.

Pay once, not many times

One payment settles many accounts, so the customer no longer repeats the flow for every bill.

Choose in the way they think

They can pick individual accounts or whole groups, whichever matches how they organise their properties.

A short, relevant list

Group views list only accounts with a pending payment, such as 12 of 200, so there is less to scan.

Confidence before paying

The review step shows the number of accounts, each amount with a remove option, and the total with VAT.

Familiar and forgiving

Cards, Apple Pay on Safari and field-level card errors behave as in B2C, and a card error keeps the customer in the same popup.

The same on any device

Every step is designed for mobile and desktop, so the task works wherever the customer is.

TRADE-OFFS

What we weighed and gave up

Each choice below bought simplicity or speed at a cost.

Reuse B2C over a fresh flow

Faster build and familiar behaviour, but less freedom to redesign steps, and the gateway page stays outside our control.

One payment, all or nothing

A single total and a simple mental model, but no partial success across accounts.

No account limit for now

Customers are not capped, but very large selections put more weight on long lists. The client asked for 100 and it is parked.

Pending accounts only in groups

Less noise, but paid accounts are not listed in the group view.

Apple Pay on Safari only

A simpler build with no QR flow, but customers on other browsers pay by card.

Failures follow B2C

No new failure screen to build, but the customer sees the existing behaviour after a failed payment.

LEARNINGS

What I would carry forward

What I would carry into the next project.

Work with the foundation

B2B reused the B2C code foundation, so the flow could not change. The useful design work was in how accounts and groups are selected.

Raise limits and failures early

An account limit arrived late from the client and no failure screen was designed. Settling limits and failure behaviour sooner avoids rework.

Name frames and states clearly

Reused frame names and a hidden layer made the files harder to read. Clear names and removing leftovers saves reviewers time.

Keep sample data consistent

Some screens showed wrong totals and mixed number formats. Consistent sample data helps reviewers trust the screens.
